ETERNALGY
ETERNAL ENERGY

Solar infrastructure for industry.

Corporate Profile 2026

Own Your Power.
Own Your Future.

One contractor, from design to decades of output.

Eternalgy Sdn Bhd is a Johor Bahru-headquartered solar PV EPCC company. We design, supply, build, commission and maintain solar systems for commercial, industrial, public-sector, developer and residential clients across Peninsular Malaysia, with one team and one point of accountability.

Vision

To be Malaysia's leading renewable energy company, empowering communities and industries through innovative, reliable and affordable solar and energy storage solutions.

Mission

To deliver high-quality, sustainable and innovative solar and energy storage solutions that create lasting value for our clients and communities, through expert engineering, reliable service and continuous improvement.

Company	**Eternalgy Sdn Bhd**
Registration	**202301029164 (1523087-A)**
Incorporated	**31 July 2023**
Paid-up capital	**RM1,000,000**
Founder & CEO	**Mr. Gan Lai Soon**
People	**62 staff: 24 executive, 38 non-executive**
Offices	**5, across Johor, Melaka, Negeri Sembilan and Selangor**
Headquarters	**01-23, Jalan Mutiara Emas 10/19, Taman Mount Austin, 81100 Johor Bahru, Johor**
CIDB	**Grade G7**

Three years. Twelve megawatts.

12
MWp+
solar PV installed and commissioned

1,100
+ sites
commissioned across Peninsular Malaysia

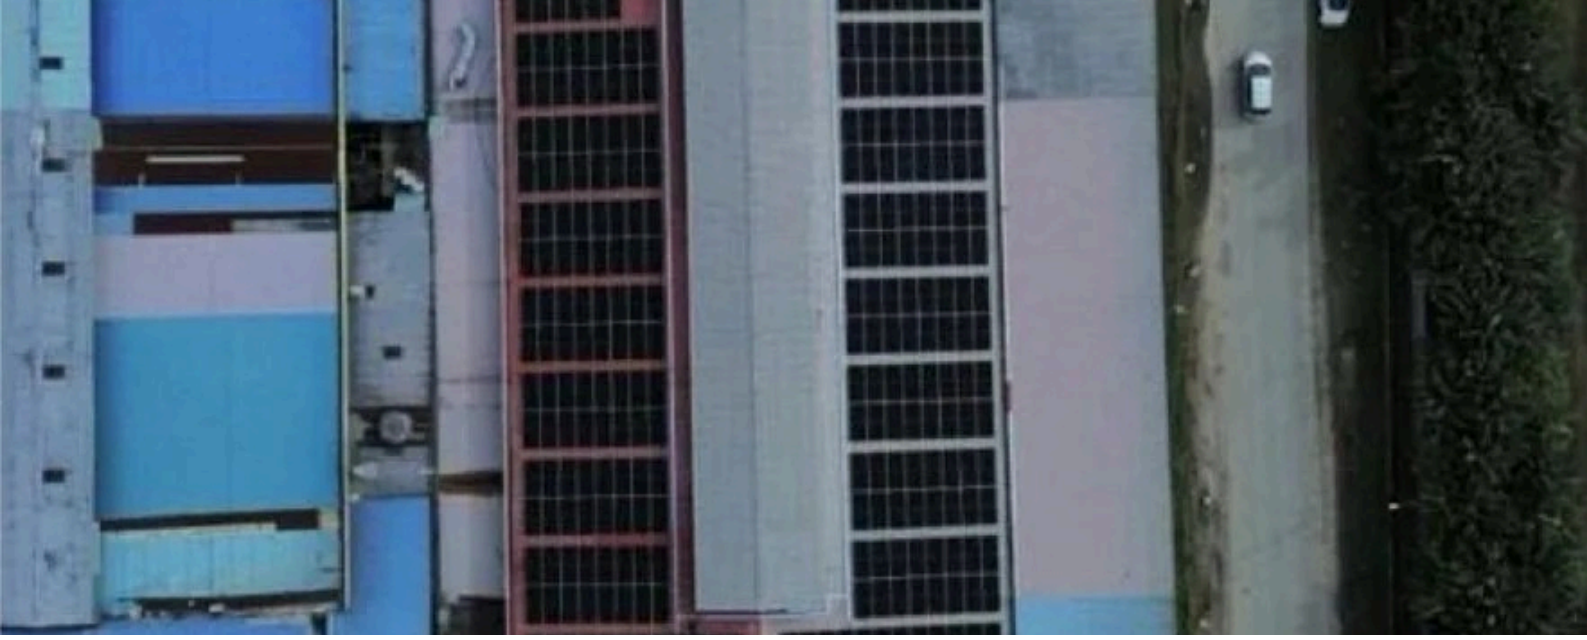

60
+ projects
commercial and industrial, completed

35
RM million+
customer revenue since 2023

G7
CIDB grade
the highest, with no limit on tender value

2023	31 July	Incorporated as Eternalgy Sdn Bhd in Johor Bahru
2024		Registered PV Service Provider, SEDA Malaysia
2025	March	Registered with CIDB Malaysia: Building, Civil Engineering, Mechanical and Electrical
	May	MyHIJAU certified by MGTC
		Registered PV Investor, SEDA Malaysia
		Golden Bull Award, Outstanding Bull, for 2024 performance
		Centre of Excellence partner, SHRDC Shah Alam
2026	June	MyHIJAU certificate for solar PV EPCC services
	July	CIDB Grade G7
	September	In-house Occupational Safety & Health Coordinator (OSH-C)
	October	12 MWp+ installed and 1,100+ sites commissioned

Installed capacity, sites commissioned and customer revenue from Eternalgy's project records as at 21 October 2026.

Capabilities

Engineering and construction

Solar EPCC
Design, procurement, construction and commissioning, by one team.

Duo Mix systems
String and micro inverters in one system.

Battery storage and off-grid
Hybrid and off-grid systems with storage.

Electrical works
Certified by Suruhanjaya Tenaga.

SEDA and TNB approvals
Prepared and submitted for you.

Financing and schemes

Zero-capex solar
Power purchase agreements and solar leasing: as a SEDA Registered PV Investor we finance, build and operate the system.

Maybank solar financing
Preferred solar PV partner.

GITA allowances
60% for solar, 100% for storage.

ATAP and SELCO
Recommended from your load profile.

CRESS and CREAM
Corporate green electricity.

Operations

eSAJ monitoring
Real-time, 24 hours a day.

Six-monthly inspection
Connections, cleaning, performance audit.

Thermal drone scanning
Faults found before they cost output.

48-hour fault response
For urgent cases, system down.

Software and IoT engineering
In-house systems, including our solar bill simulator.

EV charging

Scalable, smart charging from a single home unit to networked business sites: intelligent load management and energy optimisation, premium components with multiple safety protections.

For residential, commercial, industrial, public and fleet sites.

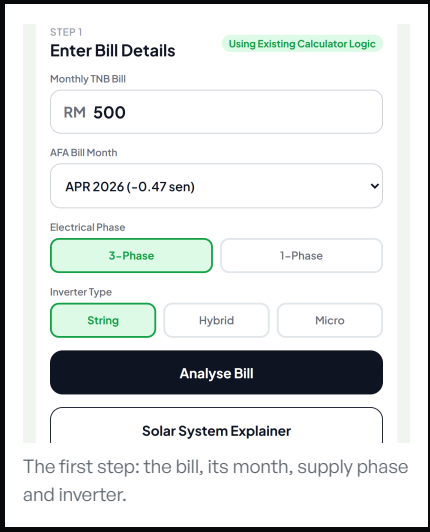

Your bill after solar, simulated from the tariff.

Most solar quotes multiply your bill by a saving percentage. The Eternalgy Solar Simulator, built in-house by our software team, does the arithmetic instead: it rebuilds your TNB bill from the tariff, follows every kilowatt-hour your system generates, and calculates the bill you will pay after solar, item by item. For homes and for businesses.

Your bill	Tariff match	System size	Energy flow	New bill	Your saving
The ringgit amount and the month on your TNB bill.	The usage that produces that bill under TNB's tariff, with that month's surcharge.	Panels sized to your usage at Malaysian sun-peak hours.	Used on site, exported, or beyond the credit cap.	Every component recalculated at your new usage.	Old bill minus new bill, plus the export credit.

What the engine models

- TNB's residential tariff in force since 1 July 2025, line by line: energy, capacity, network and retail charges
- TNB's low-voltage commercial tariff
- Sixteen months of fuel surcharge (AFA), July 2025 to October 2026
- SST and retail-charge thresholds, and the energy efficiency incentive (EEI) bands
- ATAP export rules: credit capped at what is imported, no roll-over
- Battery capacity, depth of discharge and charging losses
- Commercial load, hour by hour, against opening hours

The first step: the bill, its month, supply phase and inverter.

Why the method matters

Solar is a 25-year asset. A saving overstated by RM150 a month is not a small error: it repeats every month the system runs.

Illustration: a RM45,000 system	Saving promised	Saving achieved
Monthly saving	RM600	RM450
Simple payback	6.3 years	8.3 years
20-year saving, no tariff increase	RM144,000	RM108,000
Expectation gap over 20 years		**RM36,000**

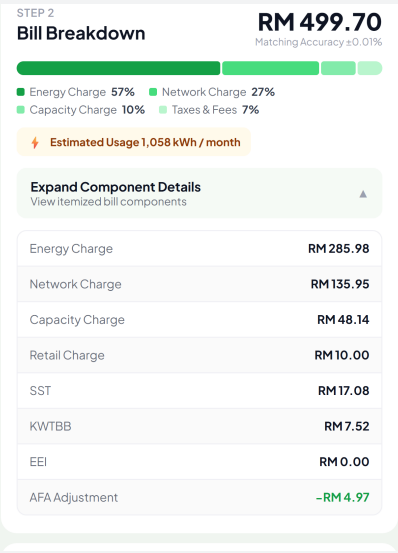

For homes: your real bill, rebuilt.

A worked example from the simulator: a RM500 bill from April 2026, three-phase supply, string inverter.

The bill becomes usage

The simulator searches TNB's domestic tariff for the usage that produces RM500 once April's fuel surcharge (−0.47 sen/kWh) is applied: **1,058 kWh a month**, rebuilt as RM499.70.

Energy charge	RM285.98	Network charge	RM135.95
Capacity charge	RM48.14	Retail charge	RM10.00
SST	RM17.08	KWTBB	RM7.52
EEI rebate	RM0.00	Fuel surcharge (AFA)	−RM4.97

The bill matched to 1,058 kWh, component by component.

The system is sized to that usage

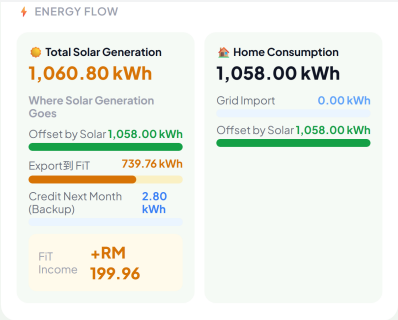

10.4 kWp
16 × 650 W panels

1,061 kWh
a month at 3.4 sun-peak hours

30%
used as it is generated

Every kilowatt-hour is followed

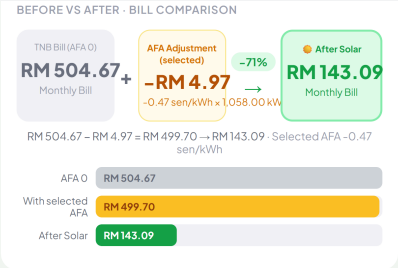

318 kWh is used as it is generated and saves the full tariff. **740 kWh** is exported and credited at RM0.2703/kWh, which is only allowed up to what the home imports that month. **2.8 kWh** is beyond that cap and earns nothing.

Where the solar goes, and where the home's power comes from.

The bill is recalculated, not discounted

Component	Before	After solar
Energy charge	RM285.98	RM199.75
Network charge	RM135.95	RM94.96
Capacity charge	RM48.14	RM33.62
SST, KWTBB and retail	RM34.60	RM14.72
Bill at the new usage	**RM504.67**	**RM343.05**
Export credit, 740 kWh × RM0.2703		−RM199.96
You pay	**RM504.67**	**RM143.09**

Before and after, with the fuel surcharge shown separately.

Estimated saving a month

RM361.58

RM504.67 → RM143.09
both at a zero fuel surcharge

For business: simulated hour by hour.

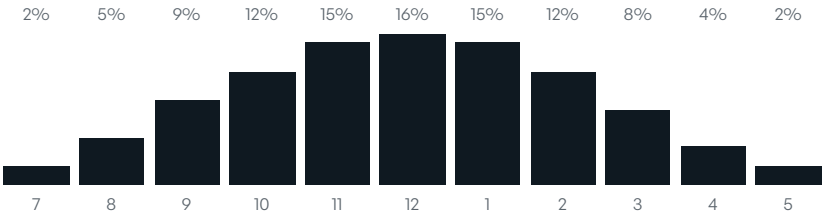

A worked example: a RM5,000 bill on TNB's low-voltage general commercial tariff.

The bill becomes usage

RM5,000 matches **9,671 kWh a month**, rebuilt as RM4,999.68: energy RM2,614.07, capacity RM853.95, network RM1,433.24, retail RM20.00, KWTBB RM78.42.

Your hours shape the result

A business uses most of its power while it is open. The simulator splits the month's usage into a round-the-clock load and an operating load spread over your opening hours, then sets each hour's solar against that hour's load. Solar arrives in a curve that peaks at noon:

Share of a day's solar generated in each hour, 7 am to 5 pm.

The system and the week

45.5 kWp	4,601 kWh	88 kWh
70 × 650 W panels	used on site a month	exported a month

The bill is recalculated, not discounted

At the new usage TNB's tariff gives a bill of **RM2,630.07**. The export earns RM17.53 at RM0.20/kWh.

Estimated saving a month

RM2,387.14

RM4,999.68 → RM2,612.54

open every day, 8 am–6 pm

Same bill, closed at weekends

Close the business on Saturday and Sunday and the same panels export most of their weekend output at the lower export rate. The simulator shows the difference instead of hiding it.

Open every day

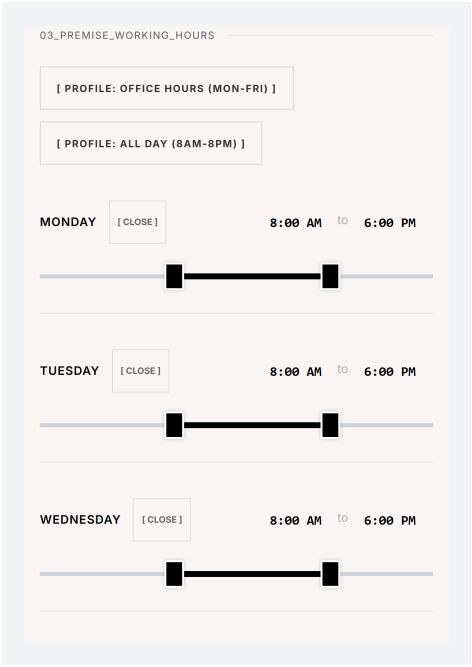

RM2,387.14

saving a month

Open Monday to Friday

RM1,978.92

saving a month; 1,383 kWh exported

Opening hours set for each day of the week.

Each day's solar, split into used on site and exported.

Why the numbers hold up.

It starts from the real bill

The bill is matched to the usage that produces it under TNB's current tariff, so the simulation knows the usage instead of guessing it from a percentage.

It applies the bill month's surcharge

The fuel surcharge (AFA) changes every month. Using the one on the bill stops the same ringgit being read as the wrong usage.

It rebuilds the bill after solar

Energy, network, capacity, retail, SST, KWTBB and the efficiency rebate are recalculated at the new usage. Tariff bands and tax thresholds fall away as they would on a real bill.

It follows every kilowatt-hour

Solar used on site saves the full tariff. Exported solar earns only the export rate, only up to what is imported that month; the rest expires, as under ATAP.

It models business hours

Commercial premises are simulated hour by hour against opening hours and round-the-clock load, so a shop closed on Sunday shows a smaller saving.

It shows its working

Every component is on screen, before and after. The customer can check the arithmetic, and so can their bank.

	Percentage estimate	Eternalgy bill simulation
Starting point	Bill × an assumed saving %	**The bill matched to usage under TNB's tariff**
Fuel surcharge	Ignored	**The bill month's AFA applied**
Daytime use and export	Treated as equal	**Valued separately: full tariff vs export rate**
Export limit	Usually ignored	**Credit capped at what is imported; the rest expires**
Bill after solar	Old bill minus the percentage	**Recalculated component by component**
Tax and rebate thresholds	Ignored	**SST, retail charge and EEI follow the new usage**
Business hours	Ignored	**Hour by hour against the opening hours**

What a simulation cannot know

Weather and season, the roof's direction and shading, changes in how much power is used, and future tariffs and rules. The simulator gives a detailed forecast, not a guarantee. We confirm it with a site survey and, ideally, up to twelve months of bills before you commit.

Figures from the Eternalgy Solar Simulator, TNB tariff in force October 2026.

The right scheme for your load profile.

We recommend the scheme from your consumption, roof and returns, and prepare the applications.

Businesses and homeowners: ATAP and SELCO

	ATAP	SELCO
What it is	Rooftop scheme from 1 January 2026, replacing NEM. Surplus is exported to the grid.	All solar generated is used on site; no export.
Excess energy	Exported and credited at the energy charge or SMP rate.	Not allowed.
Credits	Used within the same billing period; unused credits expire.	Not applicable.
Capacity, non-domestic	Up to 100% of maximum demand, capped at 1 MW.	No strict export limits; studies or BESS may apply to large systems.
Duration	10-year programme from commissioning.	Lifetime of the system.
Best for	Offsetting the bill through export credits.	On-site consumption with a simpler setup.

Developers and corporates: CRESS and CREAM

	CRESS	CREAM
Purpose	Corporates procure renewable energy from new solar plants via the TNB grid.	Demand from several companies is aggregated to procure renewable energy together.
Target user	Large corporations with high demand.	SMEs or several buyers with lower demand.
Structure	One-to-one with a solar developer.	Many-to-one; buyers grouped together.
Entry requirement	High consumption and a strong financial profile.	Lower barrier; shared participation.
Risk	Borne by the single buyer.	Shared among participants.

60%

Green Investment Tax Allowance for solar PV systems.

100%

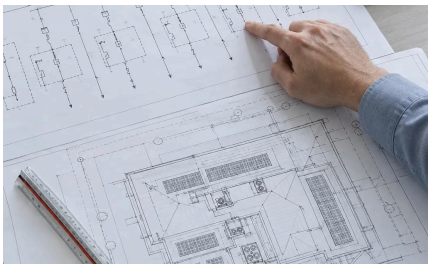

Green Investment Tax Allowance for battery storage, set off against 70% of statutory income. Qualifying capital expenditure until 31 December 2026.

70%

Malaysia's renewable share target for generation capacity by 2050.

Scheme and incentive rules are set by the relevant authorities and may change. Eternalgy advises on the latest requirements for every project.

From consultation to long-term output.

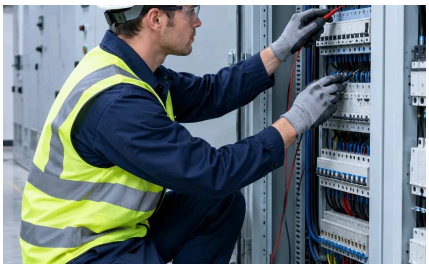

Consultation

Share your electricity bill. We simulate your bill after solar and recommend the scheme that fits.

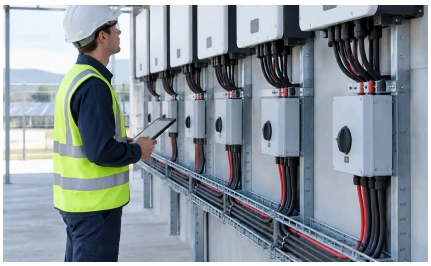

Site survey and design

Roof survey, load profile and sizing, with string and micro inverters matched to the roof.

Proposal and contract

A clear proposal with milestone-based payments, financing options and GITA incentives.

Approvals

We prepare and submit SEDA and utility applications. Regulator timelines apply.

Installation and commissioning

Certified crews with site supervision. Most C&I rooftops take 4 to 8 weeks from survey to commissioning.

Monitoring and maintenance

eSAJ real-time data, inspection every six months and thermal drone scans, backed by our hotline.

Duo Mix

String inverters on large, uniform roof areas and micro inverters on shaded or complex sections, in a single system. Each roof section gets the right conversion technology: higher yield, less single-point dependence and panel-level data.

Supply chain we control, digitally

Sole distributor for SAJ in Malaysia, with warehouses in Johor and Selangor for fast replacement. Our in-house software engineering runs cloud invoicing, cloud inventory, automated stock-keeping, scheduling and fully digital reporting.

Top grade, on record.

The Eternalgy team at the Golden Bull Award 2025.

Chosen by people who check.

Outstanding Bull Award, for 2024 performance	Golden Bull Award 2025
Centre of Excellence partner, for our contribution to the battery energy storage training facility	SHRDC, Shah Alam
Preferred solar PV partner for Maybank solar financing products, selected on component quality, installation safety and workmanship	Maybank
Sole distributor in Malaysia, under a 50 MW + 10 MWh PV and storage agreement announced in Shanghai	SAJ Electric
Technology partner for Tiger Neo 3.0 modules, AAA bankability tier	JinkoSolar

Mr. Gan Lai Soon

Founder and Chief Executive Officer

“Every roof is a power plant waiting to be engineered properly. Our job is to make that transition simple, bankable and built to last.”

Engineering grounding
B.Sc. Electronics, Universiti Teknologi Malaysia (UTM).

Client discipline
A career in the Malaysian insurance industry, with multiple industry awards, built the client-facing rigour and risk-conscious mindset that shape how Eternalgy is run.

Cross-border network
An investor with a network across Malaysia and China, which informs how we source bankable equipment such as JinkoSolar modules and SAJ inverters.

Engineering first
Technical decisions are made by certified engineers, equipment is chosen for bankability, and every project is built to hold up to banks, authorities and the client's own facilities team.

From one office to five
Under his leadership Eternalgy has grown from a single Johor Bahru office to five offices across four states. His ambition is straightforward: make solar ownership simple, bankable and genuinely mesra client, one engineered roof at a time.

The people behind it.

Mr. Gan Lai Soon

Founder and Chief Executive Officer

Ahmad Safwan bin Ahmad Nazri

Solar Design Engineer

7+ years in PV design, across sales support, design, construction, tendering and O&M. Kerian, Tanah Merah and Gebeng solar farms, and 50+ commercial and industrial sites, including international clients.

- Masters in Mechanical Engineering
- SEDA GCPV certified designer
- ST Competent Energy Manager
- CAAM RCOC-B drone operator
- CIDB Green Card · OGSP
- OSH-C course, September 2026

Mr. Lim Kim Chang

General Manager

Ahmad Faruoqi bin Ibrahim

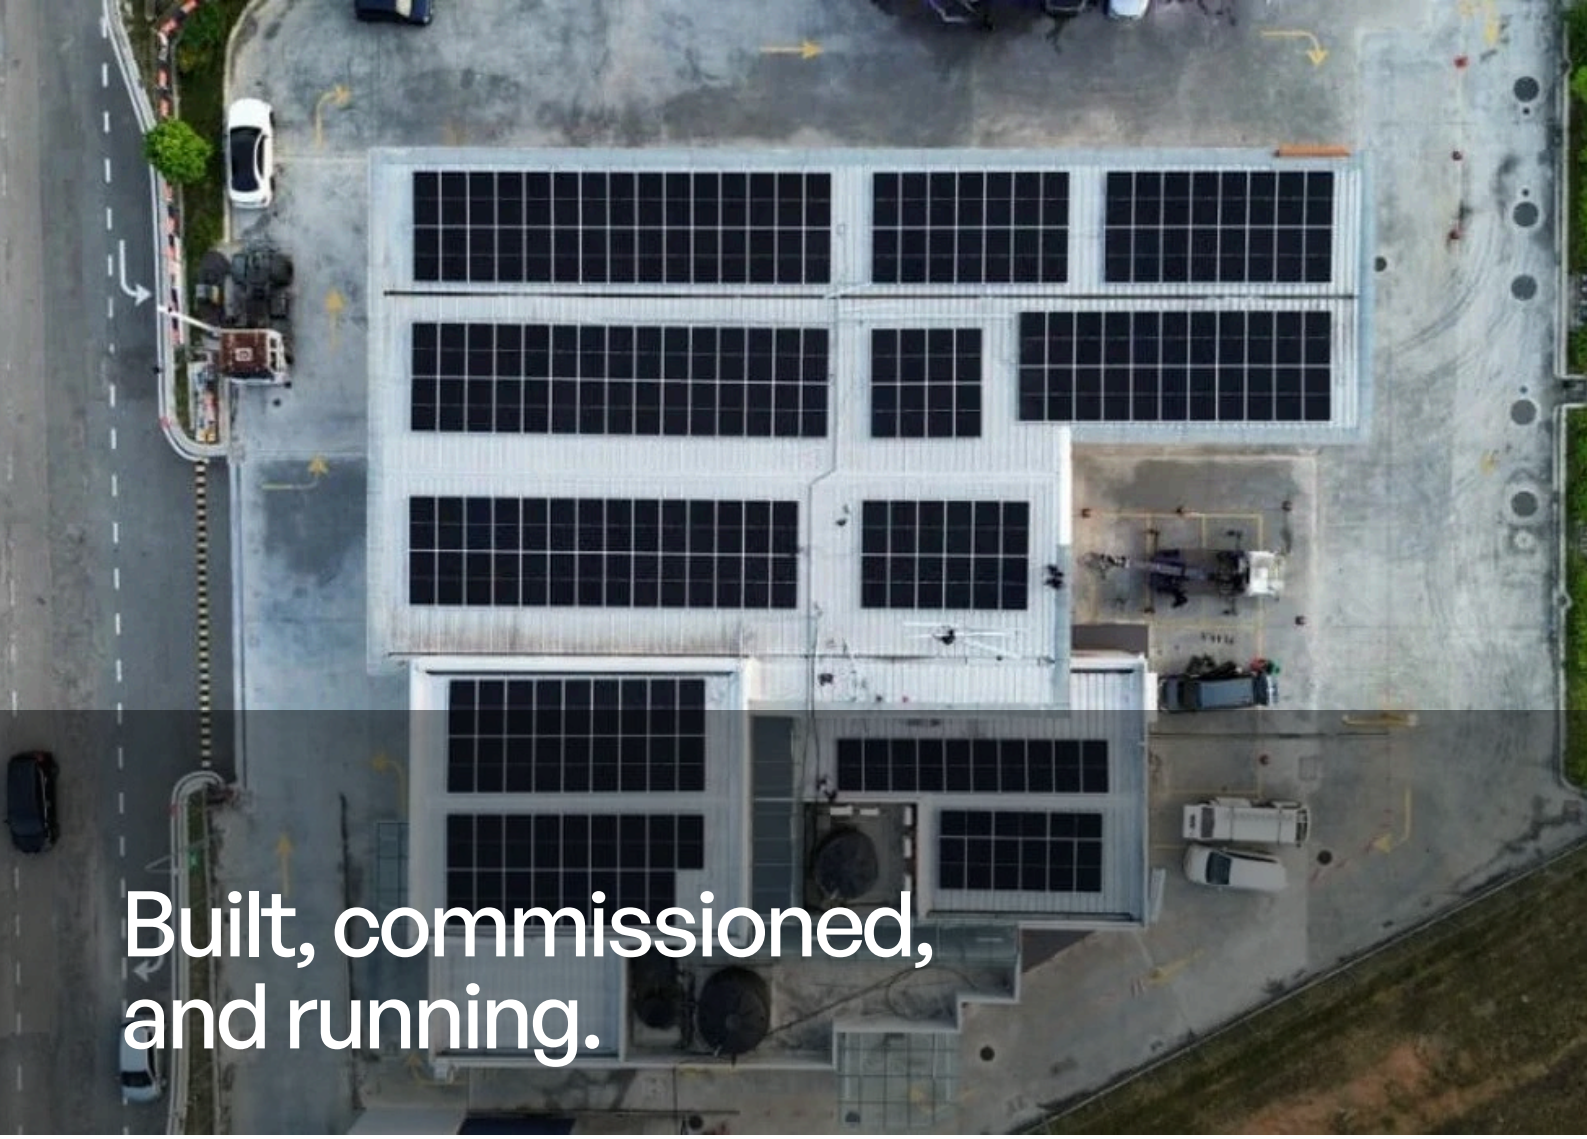

Solar O&M Engineer

10+ years in on-grid and off-grid PV, from site assessment and SEDA applications to commissioning and monitoring. 3,400+ residential systems handled; electrical engineer on a 10 MW large-scale solar project.

- Diploma in Electrical Engineering
- ST Competent PW4
- SEDA GCPV wireman and chargeman
- SEDA GCPV installation and maintenance
- MBOT certified technician
- CIDB Green Card · NIOSH OGSP and NTSP
- Certified first aider

62 people across five offices: engineering, project delivery and site supervision, sales, and administration.

Our own first-party engineering team, from design to resolution. No finger-pointing between vendors.

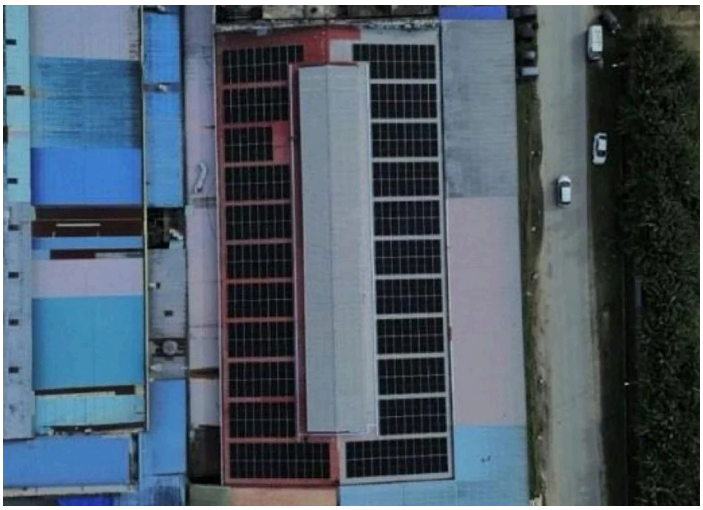

Built, commissioned, and running.

1,100+ sites commissioned, 60+ of them commercial and industrial, supported by the team that built them.

Project	Sector	Scheme	Key figure
Industrial project, Kota Tinggi	Industrial	ATAP	Major industrial installation
PETRONAS Pengerang	Off-grid site	Off-grid, BESS	11.16 kWp + 48 kWh
BHP Seri Alam	Petrol station	SELCO	126.26 kWp, 214 panels
Beach resort, Pengerang	Hospitality	NEM	First hospitality project
Taman Rinting	Residential developer	SELCO	104 homes
SHRDC, Shah Alam	Institutional	BESS	Centre of Excellence partner

Commercial and industrial.

Industrial project, Kota Tinggi

Industrial · Kota Tinggi, Johor · ATAP

A major industrial installation that marked our expansion into the industrial sector, built to the demands of a working plant for reliable, high-performance clean power.

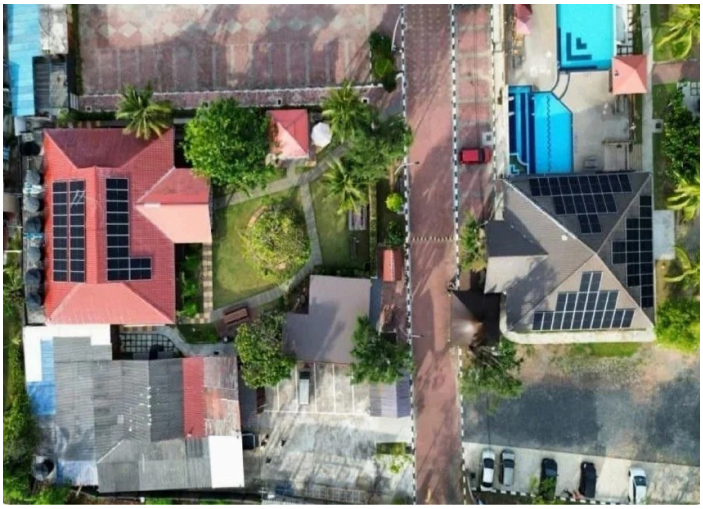

BHP Seri Alam

Petrol station · Seri Alam, Johor · SELCO

126.26 kWp

214 solar panels across the station buildings

All solar energy generated is used on site, with no export to the grid.

Beach resort, Pengerang

Hospitality · Pengerang, Johor · NEM

Our first hospitality project, engineered for a coastal environment and showing reliable renewable energy in challenging conditions.

Storage, off-grid and at scale.

PETRONAS Pengerang

Off-grid site · Pengerang, Johor · Off-grid, BESS

11.16 kWp + 48 kWh

Solar capacity and battery storage

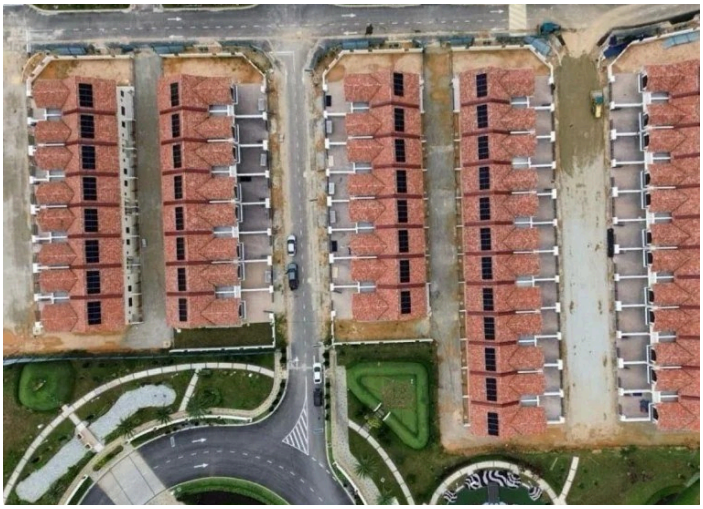

Supplies power on site with no grid connection.

SHRDC Centre of Excellence

Institutional · Shah Alam, Selangor · BESS

We contributed to the battery energy storage system training facility at the Selangor Human Resource Development Centre and were appointed a Centre of Excellence partner, supporting industry-ready talent for clean energy.

Taman Rinting developer programme

Residential developer · Taman Rinting, Johor · SELCO

104 homes

Delivered with one developer

One engineering team coordinating with the developer across every home, so each buyer receives the same system standard.

Equipment chosen for bankability.

JinkoSolar Tiger Neo 3.0

N-type TOPCon modules, bifacial glass-glass, with a quarter-cell circuit. Positioned in the AAA bankability tier, which supports project financing.

650–670 W Module power	**27.79%** Cell efficiency	**−0.26 %/°C** Temperature coefficient	**≤ 0.35%** Annual degradation
88.85% Guaranteed output at year 30	**85 ± 5%** Bifacial factor	**~84%** Output under partial shading, vs ~63% for half-cell	**AAA** Bankability tier

SAJ inverters and storage

A global inverter and energy storage manufacturer, established in 2005.

9 GW Inverter capacity a year	**3.6 GWh** Storage capacity a year	**85+** Export countries	**289** Patents

eSAJ monitoring

Real-time data, 24 hours a day

Remote settings and monitoring

Alarm notifications and error detection

Data visualisation and exportable reports

Single or multiple plant monitoring

Thermal drone scanning

DJI Enterprise thermal and visual scans find defective cells and sub-strings, connection faults, storm damage, non-functioning panels, delamination and cell rupture.

Manufacturer data; actual performance varies by site and system design.

Warranty you can hold us to.

Module power warranty JinkoSolar Tiger Neo 3.0	30 years
Module product warranty JinkoSolar	12 years
Inverter product warranty SAJ	10 years
Installation workmanship Eternalgy	3 years
System monitoring Eternalgy	3 years
Technical support Eternalgy	3 years
Roof leaking Eternalgy	1 year

24 h

eSAJ monitoring, real-time data with alarms.

6 months

Scheduled inspection: connection checks, cleaning inspection and a performance audit.

48 h

Urgent cases, system down, attended within 48 hours.

3–5 days

Standard claims resolved in 3 to 5 working days.

Warranty claims

Submit
Hotline, email or WhatsApp.

Assessment
Remote or on-site diagnosis.

Repair or replace
Under warranty.

Confirmation
System retested with you.

Warranty terms are subject to manufacturer and contract conditions.

Own your power.
Own your future.

Share your site address and electricity bills. Our engineers recommend the scheme that fits your load profile and return a system design, yield and payback.
